The UK XFEL Project: Conceptual Design

Dave Dunning, STFC Daresbury Laboratory On behalf of the project team 29th July 2024

xfel.ac.uk

Contents

- Introduction to XFELs
 - Challenges and opportunities
- Conceptual design process
 - From science requirements to facility design
- Preliminary facility design and key next-gen XFEL features
 - Multiplexing to ~6-10 FELs
 - High peak and average brightness
 - Near-transform-limited pulses
 - High pulse energy/high photon energy
 - Two-colour, synchronous sources, high data rates/AI
 - Sustainability
- Summary and next steps

Introduction to XFELs

- XFEL = X-ray Free-Electron Laser
- 'free-electron' means the electrons are not bound in atoms but 'freely' propagating in a particle accelerator

XFEL challenges and opportunities

- XFEL lasing spoils the electron bunch quality (bunches can't be re-used). So XFELs are based on *linear* accelerators: less straightforward to serve many simultaneous experiments
- The X-ray pulses are naturally far from transform limited (amplified noise). In the default SASE mode, there is an intrinsic coherence length of ~hundreds of wavelengths (hundreds of attoseconds at X-ray)

But bunch repetition rates are increasing by a factor of 10,000 compared to first-gen XFELs (~100 Hz -> ~1 MHz)
Multiplexing to more simultaneous experiments, with much higher average flux and much higher data rates

Envelope A(t) Electric field E(t) t There are many demonstrated or emerging techniques

There are many demonstrated or emerging techniques for near-transform limited pulses (i.e. high quality pulses across a range of pulse durations)

Increasing capacity and capability go hand in hand

UK XFEL conceptual design process

Understanding/defining the specification

- Capture input from the many user cases, each with different (overlapping) sets of specifications
- Incorporate new ideas developed over time

Informed by the Science Case, survey, Town Halls, Science Team meetings etc.

Specific technical solutions

 Identify and develop technical solutions to best meet each set of user requirements

Informed by research within the design team, facility visits, collaborations etc.

Compelling facility proposals

Integrate technical solutions into self-consistent facility proposals:

- Ensure compatibility of features
- Consider scope, international context, sustainability, socioeconomic factors

To develop a next-generation XFEL concept, we initially **assume a new-build facility at an international scale**, without constraints from location or from upgrading an existing machine.

Defining the specification: User survey

One of the first major activities towards the CDOA phase was a detailed survey to capture requirements

- Structured around the Science Case and recorded more granular specifications
- Captured ~70 case studies: each includes several 'tick box' parameters and text entries
- Very useful for defining high-level accelerator and FEL choices, and as a starting point for more detailed areas

UK-XFEL Facility Requirements Survey	FEL Sources Type 1 For FEL sources, feel free to tick multiple boxes to indicate a range. End Station Away Day (28th Feb 2024)

FEL-1 (13 - 30 keV)

FEL-1 (20 - 40 keV)

~100 Hz – 1kHz

- Identified key end stations and relevant team members.
- Associated end stations with specific FELs and completed specification spreadsheet for each
- Follow-up meetings with each group are underway

UK XFEL Next Generation Definition

- Evenly spaced, high repetition rate pulses to match samples, lasers, and detectors •
 - 100 kHz per FEL, with flexibility of repetition rate
- High efficiency facility, with a step-change in the simultaneous operation of multiple end stations
 - Minimum of six FELs, with upwards of ten end stations to be simultaneously operated
- Near transform-limited operation across the x-ray range
 - Photon energies from 0.05-20 keV
 - Pulse durations from 100 as to 100 fs
 - Non-transform-limited operation at 20-50 keV
- Widely separated, multiple colour x-rays to at least one end station
- Full array of synchronized sources ۲

Science and

Facilities Council xfel.ac.uk

Technology

- XUV-THz, e-beams, ion beams, high power & high energy lasers at high repetition rate
- Improved synchronization/timing data with external lasers to <1 fs
- Minimal carbon footprint with minimal energy consumption for both operation and build

- Multiplexing to ~6-10 FELs
- High peak and average brightness
- Near-transform-limited pulses
- High pulse energy/high photon energy
- Two-colour, synchronous sources, high data rates/Al
- Sustainability

Evolution of peak and average brightness

- Superconducting accelerator technology enables a significant increase in average brightness, as well as peak brightness
- Advanced FEL modes provide further advantages

Top-level facility design choices

- Max. photon energy strongly influences the required electron beam energy
- Repetition rate largely dictates the type of acceleration technology
- Requirements suggest
 ~8 GeV superconducting
 RF linac

Near-transform-limited pulses

 Attosecond pulses tightly synchronised to external sources (e.g. XLEAP)

Advances in high reprate lasers (e.g. Kagome fibres) for ≤ 1 MHz UV **seeding** + harmonic FEL conversion to ≤ 2 keV

Generating near-transform-limited pulses across a wide range of energies and pulse lengths requires a variety of techniques

> **HB-SASE** for 25keV, 2.5 fs duration, TW peak power, >mJ pulse energy, 8 × 10⁻⁵ FWHM BW, at any e-beam repetition rate **HB-SASE** schematic Electron delay Enhanced self-• seeding for few-GW 30 fs stable coherent SXR pulses Cavity XFELs: RAFEL, **XFELO** for narrowest

> > bandwidth

Proposed FEL modes

Each FEL has 1-3 primary operating modes, covering both short-pulse and long-pulse options

*via booster, possibly at lower rep. rate

Pulse durations estimated from simulations/scaling, intermediates between short and long pulse modes also accessible.

Other FEL capabilities

High pulse energy/high photon energy

- Requirement for 10's of mJ at 5-10keV, and as many mJ as possible at up to 40keV
- To approach 10's <u>mJ</u> pulse energy, and to reach 40keV, we need a GeV – assume booster to ~12 GeV
- But we also need a wide photon energy range....
- · Suggestion is to use an undulator with dual periods.
- · EuXFEL are developing a planar SCU which incorporates period doubling:
- Superconducting undulator coils with period length doubling

- Widely-separated two-colour capability could be a key feature of a next-generation XFEL
- Various concepts to generate SXR + HXR combinations

han 8 • We need

At maximum current of 450A:

At 12 GeV:

(ke) 30

20

10

• SCU17: Period 17mm, B = 1.26T, K = 2

SCU34: Period 34mm, B = 2.6T, K = 8.54

SCU17: Tunes 26keV (K = 2) to 53keV (K = 1)

SCU34: Tunes 1keV (K = 8.54) to 26keV (K = 1)

•

We need a beam energy considerably greater than 8 GeV – assume booster to ~12 GeV

Demand for 10's mJ pulse energy at 5-10 keV,

Potential to use dual-period undulators

and to reach 40 keV

Concepts for twocolour

- Widely-separated two-colour capability could be a key feature of a next-generation XFEL
- End station away day activities identified a specific combination for detailed studies ("FEL-5b" + FEL-2 i.e SXR/HXR)
- 3 concepts developed with similar key features:
 - bunch pattern from the injector is adjusted to bring two bunches into adjacent RF cycles (Δt = 0.77 ns)
 - a GHz subharmonic deflecting cavity used to deflect one bunch onto an adjacent FEL
 - path length difference compensates the temporal separation

Technology Facilities Council Xfel. ac. uk

Other key facility features

Synchronous sources

A laser facility as well as an XFEL facility:

- High rep. rate femtosecond pumping from 10 nm 10 μm, as per UK Artemis and Ultra facilities
- A high power (multi-PW, >10²² Wcm⁻²) and high energy (kJ-class) laser facility as large as budget allows
 - Scalable and tunable diode-pumped laser technology (e.g. CLF DiPOLE)
 - High repetition-rate (>10 Hz)

Science and

Facilities Council

Technology

xfel.ac.uk Central Laser Facility's

Next-gen XFELs are expected to be some of the biggest data machines on the planet

Unprecedented requirements in both data rates (towards TB/s) and scale (PB per data set). Al potential for real-time feedback for experiment steering. Trend for data processing at the detector as part of combined detector-data pipeline

Focus is on the following areas:

- Data handling
- Applications of Machine Learning at an XFEL
- Conceptual designs and frameworks to enable Machine Learning
- Developing connections with relevant AI and Exascale expertise within the UK

Data Centres

Footprint ~ 80x30m Power ~ 6MW

Sustainability

The UK accelerator community is already very active in developing more sustainable technologies:

- Using permanent magnets instead of electromagnets
- Making use of different superconducting materials and coatings for RF cavities so that they can
 operate at 4K instead of 2K
- Developing more efficient RF power sources and much faster RF cavity tuners

In addition we are assessing accelerators more broadly in terms of carbon footprint throughout the full project life cycles (many other factors besides accelerator technology: buildings, travel, data centres etc.). This analysis will continue and feed directly into the CDOA project.

Preliminary layout (2)

Various options are still being considered for different aspects of the design, aiming to produce a self-consistent design by October 2024

Summary and next steps

- XFELs are a revolutionary technology, which are set to develop substantially in capability and capacity in coming years
- We've formed strong links with existing XFELs, working towards similar aims
- We've made significant progress in developing a concept to meet the key requirements: self-consistent design by October 2024
- Next, we will compare UK vs international investment options + identify key R&D areas for future phases
- Continuing Town Hall meeting series to extend the community and inform the design <u>https://xfel.ac.uk/events/</u>
 - North-West England Townhall (hosted by Royce Institute, 8th and 9th August 2024)
 Focus discussion topic: Electronics, photonics and quantum technologies
 - Wales Townhall (hosted Cardiff 17th and 18th September 2024)
 Focus discussion topic: Advanced materials and manufacturing
